Emerald Ash Borer Has Been Detected in Longmont

Emerald ash borer (EAB) was detected in Longmont, CO, on Monday, June 6th, 2016, at a residential location which has not been officially released. The detection falls within an existing EAB quarantine area around Boulder County, in which the City of Longmont resides. The quarantine area was set up in an effort to prevent the human-assisted spread of this devastating insect.

It is still unclear whether the insect arrived in Longmont naturally, or unknowingly by human transportation.

Emerald ash borer was first detected in Boulder in September of 2013. This is the first known case of emerald ash borer detection outside of the Boulder city limits.

According to a press release from the Colorado State Forest Service, Longmont is estimated to have an ash tree population of approximately 43,000 trees. The city's Forestry Services Department manages 2,800 of those trees, located in public rights-of-way, parks and other city properties.

Tom's Talk

By Tom Tolkacz, CEO

As the year comes to a close, we'd like to express our sincere appreciation to all our loyal customers, and welcome those who've joined us this year. We thank you for your continued business.

Much has changed since this time last year, most notably the arrival of emerald ash borer (EAB) in the City of Longmont. With this recent discovery, EAB is definitely a reality here in Colorado. I strongly urge you to read the information in this newsletter, which provides in-depth statistics, as well as helpful tips for ash tree identification and more. I cannot stress enough how important it is for homeowners and property managers to view EAB as a significant threat. The good news is you have treatment options to prevent the destruction.

The Cities of Denver, Edgewater, Lakewood, Westminster and many others have proactive plans to save their ash trees. The question is, do you?

On a lighter note, Swingle celebrated two milestone openings this spring: our new northern Colorado regional headquarters in Firestone, and the *Pollinator Pathway* at the Denver Zoo. Each continues to build on our commitment to the communities we serve and the environment we are ultimately responsible for.

We were also honored this July by the Colorado Department of Labor and Employment for our continued commitment to safety. Twenty-five years ago, Swingle was one of the first Colorado companies to be accredited with the Premium Cost Containment Program designation, which helps employers find ways to control workforce injuries and insurance-related costs. We're proud to say that we continue our commitment to safety each and every day. Congratulations to everyone on the Swingle team.

As always, contact us if you have any concerns about your landscape. We look forward to making your life more enjoyable this year and for many years to come.

Thomas R. Tolkacz, CEO

Prepare your property before the winter weather arrives.

PROPERTY Checklist

- Cover or store **patio furniture** and **grills** to protect them from the elements.
- Turn **outdoor faucets** off inside your home – remember to leave the outside open to drain excess water.
- Cut down **perennials** – this is also a good time to divide and plant elsewhere.
- Drain **garden hoses** and store them inside to prevent damage.
- Make sure **storm drains** point away from the house to prevent ice build up.
- Inspect **outdoor lighting** for dead bulbs and dirty lenses. A well-lit property prevents slips and falls on icy surfaces.
- Clay and fragile **planters** should be moved indoors to prevent cracking.

Ask Our EXPERT

Tony Hahn

Fall and Winter Preparation

Why do you prune trees in the dormant season?

Some trees are more susceptible to disease than others. If they become infected and the disease is not pruned out, it can and will spread more deeply into the tree. Pruning when temperatures are colder and humidity levels are lower minimizes the risk of spreading active infections. Dormant pruning typically is scheduled between mid November and early April.

Why is winterizing your lawn so important?

Root growth and development are the most important reasons to prepare your lawn prior to winter's onset. Without a strong, deep root system, your lawn becomes stressed and is less likely to withstand extreme winter weather.

Front range communities can experience long durations of dry weather between snowstorms.

Roots are primarily made up of proteins and carbohydrates - derived from nitrogen-based fertilizers. Other components of root function are potassium and phosphorous - included in "winterizer" fertilizers. Many years of experience in the lawn care industry has reinforced that without good root growth in the fall, your chances of having a beautifully thick lawn come the spring are greatly reduced.

How does fall aeration help your lawn in the spring?

Clay soils, which encompass much of the front range, are notoriously compact. Heavy, wet, clay soils do not contain much oxygen, which is necessary for respiration and root growth. Soils with lots of organic matter have naturally occurring pore spaces, allowing plenty of oxygen into the soil. Since clay soils compact easily, it is critical to alleviate the compaction for better air, water, and fertilizer penetration to the roots.

Aeration is suggested at least twice a year. Overseeding, which often accompanies a fall aeration, is also recommended when soil temperatures are still high enough to allow for germination. Seeding also helps break up monocultures in lawns, which can increase disease resistance as well. If you want a healthy and beautiful lawn come the spring, you have to do some work in the fall.

Tony Hahn is one of Swingle's Landscape Care Consultants and a Certified Arborist. He's known as "The Voice of Swingle", as seen on our local Colorado TV stations.
