

Late Spring Lawn Program

Your late spring application of specially blended fertilizer is designed to give your lawn a deep rich green color. We applied pre-emergent to help control crabgrass and spurge as they germinate. Broadleaf weeds have been treated as needed. Weeds in the lawn should die off in approximately 10 to 14 days.

Watering:

Please refrain from watering for 30 minutes after the application. A light rain or snow will not affect this application. When possible, complete all watering between 6 and 9 am. Avoid over-watering shady areas. Brown or dry areas in the lawn are commonly the result of dry conditions. These areas will need heavy watering for 5-7 days. If brown areas persist after extra watering, please call Swingle for a free courtesy visit to evaluate the cause of the problem.

Mowing:

Sharp mower blades and proper mowing height are very important to a green and healthy lawn. Set mowing blades at a 2 1/2" to 3" height. This height will help conserve water, enhance color and improve the roots of the grass plant.

Cultural Notes:

Piles or rows of clippings left on the lawn after mowing will need to be picked up. This will ensure your lawn receives enough sunlight and oxygen.

Your next lawn application:

Your next application will be in 5-7 weeks.
