

Caring for Your New Seed

Following the lawn aeration and overseeding, consistent watering is the key to success. Lack of water is the main reason seeding attempts fail. We recommend the following guidelines for the care of your new seed.

How to Care For Your New Seeds:

Once you begin consistent watering, the seed will begin to sprout in 10 days to 14 days.

The seed needs to be lightly watered for 5-10 minutes, two or three times a day. For the best results keep the seeds and newly sprouted seedlings moist.

When you see sprouts, it's important to consistently water for 3 to 4 weeks. Spring and fall seasons are ideal times to establish new seedlings due to naturally occurring moisture and cooler nighttime temperatures.

While you are caring for your new seed remember "if they dry out, they die out".
